Pred. No. is the number of results predicted by chance to have a
score greater than or-equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                               Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                incorporation of labeled ddCTP and ddATP, is new. The modified DNA polymerase, has proofreading 3'.5' exonuclease activity during DNA sequencing from a template and the polymerase excises mismatched nucleotides from the 3' terminus at a faster rate than it removes correctly matched nucleotides. The polymerase is used particularly for DNA sequencing, also, for filling in 5'-overhangs, synthesis of DNA probes by random primer labeling and in site-directed mutagenesis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA polymerase that is modified (see AAV91930) so that during DNA sequencing, it effectively incorporates all four fluorescent dye-lal dideoxynucleotide triphosphates (ddNTP), or their analogs, and reduthe discrimination, observed with the unmodified enzyme, for incorporation of labeled ddCTP and ddATP, is new. The modified DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

at each cooling step. The invention contemplates single-reaction RT-PCR wherein reverse transcription and amplification are performed in a single continuous procedure. Primers, template, nucleoside triphosphates, appropriate reaction buffer having magnesium ions, reaction conditions, and polymerase are used in the PCR process, which involves denaturation of target DNA, hybridisation of primers and synthesis of complementary strands. The present sequence is Bacillus stearothermophilus (Bst) DNA polymerase 1 protein fragment which lacks 5' to 3' exonuclease activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Reverse transcription of RNA using Tvu and Bst DNA polymerase, comprises combining the polymerase, RNA containing sample, a primer and reaction buffer having magnesium ions and reacting the mixture to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     thermostable DNA polymerase such as Thermoactinomyces vulgaris (Tvu) and Bacilius stearothermophilus (BSt) DNA polymerase. Tvu and Bst DNA polymerase are useful for reverse transcription reactions which allows repetitive heating/cooling cycles without the requirement of fresh enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to reverse transcription of RNA templates using

The present sequence of the polymerase that, during DNA sequencing, effectively DNA polymerase that, during DNA sequencing, effectively incorporates all four fluorescent dye-labeled dideoxynucleotide triphosphates (ddNTP), or their analogs, and reduces the discrimination, triphosphates (ddNTP), or their analogs, and reduces the discrimination, with the unmodified enzyme, for incorporation of labeled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1930
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gene (AAT04801) to remove a 195 bp HincII-PwIII fragment from the region encoding the 5'-3' exonuclease. The deleted fragment removes 65 amino acids (residues 178-242 of the protein) including 2 Gly residues though to correspond to 2 amino acids in the E.coli DNA polymerase I necessary for 5'-3' exonuclease activity. The modified DNA polymerase can be used in primer extension reactions such as DNA sequencing or polymerase chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hong
                                                                                                           The present sequence shows a modified Bacillus stearothermophilus DNA polymerase that, during DNA sequencing, effectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the amino acid sequence of the modified Bacillus stearothermophilus thermostable DNA polymerase encoded by the clone Bst3 which contains a deletion in the 5^{\circ}-3' exonuclease domain. The correspondence was constructed by digestion and recombination of the full length

      The invention relates to reverse transcription of RNA templates using thermostable DNA polymerase such as Thermoactionwyces vulgaris (Tvu) and Bacillus stearothermophilus (Bst) DNA polymerase. Tvu and Bst DNA polymerase are useful for reverse transcription reactions which allows repetitive heating/cooling cycles without the requirement of fresh enzyme at each cooling step. The invention contemplates single-reaction RT-PCR wherein reverse transcription and amplification are performed in a single continuous procedure. Primers, template, nucleoside triphosphates, and polymerase are used in the PCR process, which involves denaturation of target DNA, hybridisation of primers and synthesis of complementary extrand The process of primers and synthesis of complementary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ddCTP and ddATP, is new. The modified DNA polymerase, has proofreading 3'-5' exonuclease activity during DNA sequencing from a template and the polymerase excises mismatched nucleotides from the 3' terminus at a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         faster rate than it removes correctly matched nucleotides. The polymerase is used particularly for DNA sequencing, also for filling in 5'-overhangs, synthesis of DNA probes by random primer labeling and in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SSX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            888
                                                                                          The invention provides compositions comprising thermostable DNA copymerases derived from hyperthermophilic eubacteria, in particular, a purified and isolated Thermoactinomyces vulgaris (Tvu) DNA polymerase can be aving DNA synthesis activity. It is useful for determining the nucleotide base sequence of a DNA molecule. Tvu DNA polymerase can be used for processes of high temperature nucleic acid amplification and coule for processes of high temperature reverse transcription in the sequencing without substantial loss of DNA synthesis activity. The enzyme can be used to perform high temperature reverse transcription in the casence of manganese ions and in high throughput robotically manipulated procedures because greater enzymatic stability is retained at room temperature. Using the Tvu DNA polymerase, reverse transcription reactions can be conducted at increased temperatures so that secondary controlled sequence of a 5'-3' exonuclease deletion mutant form of two DNA polymerase called T289M.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polymerase T289M truncated mutant. This Tvu T289M mutant is obtained by deleting 288 amino acids from the N-terminal end of wild-type T.

                                                                                                                                                                                             Matches
                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                       This is the protein sequence (589 amino acids) of the Bacillus stearothermophilus strain DNA polymerase. The heat stable DNA polymerase can be used in a method for the replication of a DNA chain. It can also be used in a method for the determination of the sequence of DNA chain. As the DNA polymerase has a proof reading 3'-5' exonuclease activity, possible mismatches of base pairing that occurs in current methods of DNA sequence determination of a DNA clone can be avoided.
                                                                                                                                                                                                                                                                                                                                                                                   Claim 9; Pages 29-30; 32pp; Japanese.

This clone encodes the sequence of a natural degradation product obtained when the DNA polymerase clone Bst3 (AAT04803) is expressed in E.coli. The same sequence is found when the full length clone (AAT04801) is expressed and cleaved with subtilisin to produce a "Rienow-Type" DNA polymerase. This sequence starts with the Val residue at pos. 287 of the full length protein. This contrasts with a commercially available B.stearothermophilus DNA polymerase subtilisin fragment where the protein sequence starts with the Ala residue corresp. to pos. 290. The modified DNA polymerase can be used in primer extension reactions such as DNA sequencing or polymerase chain reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           24-FEB-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            at each cooling step. The invention contemplates single-reaction RT-PCR wherein reverse transcription and amplification are performed in a single continuous procedure. Primers, template, nucleoside triphosphates, appropriate reaction buffer having magnesium in reaction conditions, and polymerase are used in the PCR process, which involves denaturation of target DNA, hybridisation of primers and synthesis of complementary strands. The present sequence is Thermoactinomyces vulgaris Twu DNA polymerase M285 truncated mutant. This Tvu M285 mutant is obtained by deleting 284 amino acids from the N-terminal end of wild-type T. vulgaris
                                                                                                                                                                                                                Tvu DNA polymerase; deletion mutant; M2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       thermostable DNA polymerase such as Thermoactinomyces vulgaris (Tvu) and Bacillus stearothermophilus (Bst) DNA polymerase. Tvu and Bst DNA polymerase are useful for reverse transcription reactions which allows
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Reverse transcription of RNA using "Yu and Bst DNA polymerase, comprises combining the polymerase, RNA containing sample, a prime reaction buffer having magnesium ions and reacting the mixture to

                                                                                                                             δÃ
                                                                                                                                                                                                                                                                                                           The invention provides compositions comprising thermostable DNA

C polymerases derived from hyperthermophilic eubacteria, in particular,

C a purified and isolated Thermoactinomyces vulgaris (Tvu) DNA polymerase

C having DNA synthesis activity. It is useful for determining the

C nucleotide base sequence of a DNA molecule. Tvu DNA polymerase can be

C used for processes of high temperature nucleic acid amplification and

C sequencing without substantial loss of DNA synthesis activity. The enzyme

C can be used to perform high temperature reverse transcription in the

C absence of manganese lons and in high throughput robotically manipulated

C procedures because greater enzymatic stability is retained at room

C temperature. Using the Tvu DNA polymerase, reverse transcription

C reactions can be conducted at increased temperatures so that secondary

C structure is removed or limited. The present sequence represents the

amino acid sequence of a 5'-3' exonuclease deletion mutant form of
